General remarks:
INTRODUCTION

0. The Government of India felt the need for a permanent agency to expedite the publication of standards and development of test facilities in parallel when the work on the preparation of the standards is going on, as the development of improved safety critical parts can be undertaken only after the publication of the standard and commissioning of test facilities. To this end, the erstwhile Ministry of Surface Transport (MOST) has constituted a permanent Automotive Industry Standards Committee (AISC) vide order No. RT-11028/11/97-MVL dated September 15, 1997. The standards prepared by AISC will be approved by the permanent CMVR Technical Standing Committee (CTSC). After approval, the Automotive Research Association of India, (ARAI), Pune, being the Secretariat of the AIS Committee, has published this standard. For better dissemination of this information ARAI may publish this document on their Web site.

0.1 Accordingly AIS-012 covering performance requirements of lighting and light-signalling devices for motor vehicles having more than three wheels, trailers and semi-trailers has been published in 2004 and implemented thereafter in 2005. With technological advancement in lighting and light-signalling devices and updation in ECE regulations, AIS-012 was taken up for revision and now is prepared in ten parts. This part covers performance requirements for front fog lamps for motor vehicles.

0.2 This standard applies to front fog lamps, which may incorporate lenses of glass or plastic material. It incorporates two distinct classes.

The original front fog lamp, class "B" since inception, has been updated to incorporate the angular coordinate system with an amendment to the values in the relevant photometric table. With this class, only light sources as specified in AIS-034 (Part 1 and 2) (Rev. 1) : 2010 are allowed.

The class "F3" is designed to increase photometric performance. In particular the beam width and the minimum luminous intensities below the H-H line (paragraph 6.4.3.) have been increased whilst controls on the maximum intensity in the foreground are introduced. Above the H-H line, the intensity of the veiling light is reduced to improve visibility. Additionally this class may provide adaptive beam patterns where the performance is varied according to the visibility conditions.

The introduction of the class "F3" provides for requirements that are amended to be similar to those of a headlamp as follows:

(a) The photometric values are specified as luminous intensities using the angular coordinate system.

(b) Light sources can be selected according to the provisions of AIS-034 (Part 1 and 2) (Rev. 1) (Incandescent filament light sources) and (gas discharge light sources). Light emitting diode (LED) modules and distributed lighting systems may also be used.

(c) The cut-off and the gradient definitions.

(d) The photometric requirements permit the use of asymmetrical beam distributions.
0.3 While preparing this standard considerable assistance has been derived from following ECE regulation.

| ECE R19 Revision 5 – Corrigendum 2 – Addendum 18 (Corrigendum 3 to 03 series of amendments) - Date of entry into force: 10 March 2009 | Uniform Provisions Concerning the approval of Power-Driven Vehicle Front Fog Lamps |

0.4 The following standards contain provisions, which through reference in this text constitute provisions of the standard.

| AIS-053:2005 | Automotive Vehicles – Types – Terminology |
| AIS-008 (Rev.1):2010 | Installation Requirements of Lighting and Light-signalling Devices for Motor Vehicle having more than Three Wheels, Trailer and Semi-trailer excluding Agricultural Tractor and Special Purpose Vehicle |
| AIS-010 (Part 5) (Rev. 1):2010 | Requirements of Chromaticity Co-ordinates of Colour of Light Emitted from Lighting and Light-signalling Devices |
| AIS-037:2004 | Procedure for Type Approval and Establishing Conformity of Production for Safety Critical Components |
| ISO 105 | Textiles - Tests for Colour Fastness - Part E03: Colour Fastness to Chlorinated Water (Swimming-pool Water) |
| IEC Publication 60061, | Lamp Caps and Holders together with Gauges for the Control of Interchangeability and Safety. |

0.5 The AISC panel and Automotive Industry Standards Committee (AISC) responsible for preparation of this standard are given in Annex N and Annex P respectively.

Performance Requirements for Front Fog Lamps for Motor Vehicles

0. SCOPE

This standard applies to front fog lamps for vehicles of categories L, M, N and A1.

Note: The permission to use front fog lamps covered by this standard are governed by requirements specified by the standard for installation of requirements of that category of vehicles.

1. DEFINITIONS

For the purpose of this standard,

1.1. The definitions given in AIS-008(Rev.1) and its amendments in force at the time of application for type approval shall apply to this standard.

1.2. "Lens" means the outermost component of the front fog lamp (unit), which transmits light through the illuminating surface;

1.3. "Coating" means any product or products applied in one or more layers to the outer face of a lens;

1.4. "Front fog lamps of different types" are front fog lamps that differ in such essential respects as:

1.4.1. the trade name or mark;

1.4.2. different "Classes" (B or F3) identified by particular photometric provisions;

1.4.3. the characteristics of the optical system; (basic optical design, type / category of light source, LED module, DLS etc.);

1.4.4. the inclusion of components capable of altering the optical effects by reflection, refraction, absorption and/or deformation during operation and the variable intensity control, if any;

1.4.5. the category of filament lamp(s) used, as listed in AIS-034 (Part 1 and 2) (Rev. 1)/or the LED module or light generator specific identification code (s) (if applicable);

1.4.6. the materials constituting the lenses and coating, if any.

1.4.7. However, a device intended for the installation on the left side of the vehicle and the corresponding device intended for the installation on the right side of the vehicle shall be considered to be of the same type.

---

1/ As defined in AIS-053: Automotive Vehicles - Types - Terminology
1.5 “Colour of the light emitted from the device” The definition of the colour of the light emitted, given in AIS-010 (Part 5)(Rev. 1) and its amendments in force at the time of application for type approval shall apply to this standard.

1.6 References made in this standard for filament lamp(s) shall be referred to AIS-034 (Part 1 and 2) (Rev. 1) and their amendments in force at the time of application for type approval.

2. APPLICATION FOR APPROVAL

2.1. The application for approval shall be submitted by the applicant as given in Annex A.

2.2. The application relating to each type of front fog lamp shall be accompanied by:

2.2.1 drawings, in triplicate, in sufficient detail to permit identification of the type and representing a frontal view of the front fog lamp, with the relevant details of the optical components if any, and the cross-section; the drawings shall indicate the space reserved for the approval mark as per AIS-037.

2.2.1.1 If the front fog lamp is equipped with an adjustable reflector, an indication of the mounting position(s) of the front fog lamp in relation to the ground and the longitudinal median plane of the vehicle, if the front fog lamp is for use in that (those) position(s) only;

2.2.2. For the test of plastic material of which the lenses are made:

2.2.2.1 Thirteen lenses;

2.2.2.1.1 Six of these lenses may be replaced by six samples of material at least 60 x 80 mm size, having a flat or convex outer surface and a substantially flat area (radius of curvature not less than 300 mm) in the middle measuring at least 15 x 15 mm);

2.2.2.1.2 Every such lens or sample of material shall be produced by the method to be used in mass production;

2.2.2.1.3 A reflector to which the lenses can be fitted in accordance with the manufacturer's instructions.

2.2.3. The materials making up the lenses and coatings, if any, shall be accompanied by the test report of the characteristics of these materials and coatings if they have already been tested.

2.3. In case of Class B front fog lamps:

2.3.1 a brief technical specification including the category of filament lamp used as listed in AIS-034 (Part 1 and 2) (Rev. 1) and their amendments in force at the time of application for type approval, even if the filament lamp cannot be replaced;
2.3.2 Two samples of each type of front fog lamp, one sample intended for the installation on the left side of the vehicle and one sample intended for the installation on the right side of the vehicle.

2.4. In case of Class F3 front fog lamp,

2.4.1. a brief technical specification including the category of the light source(s) used; this (these) light source category(ies) shall be listed in AIS-034 (Part 1 and 2) (Rev. 1) and their amendments in force at the time of application for type approval, even if the light source cannot be replaced;

2.4.2. in the case of LED module(s) or a light generator, the specific identification code of the module shall be stated. The drawing shall contain sufficient details to identify it and the position intended for the specific identification code and the trade mark of the applicant.

2.4.3. the make and types of the ballast(s) and /or the light source control gear, where applicable, shall be specified:

2.4.3.1. in the case of an adaptive front fog lamp, a concise description of the variable intensity control.

2.4.3.2. in case of the use of a light source control gear not being part of the device, the voltage(s) with tolerances or the total voltage range at the terminals to that light source control gear.

2.4.4. If the front fog lamp is fitted with LED module(s) or a distributed lighting system, a brief technical specification shall be provided. This information shall include the part number assigned by the light source manufacturer, a drawing with dimensions and the basic electrical and photometric values, an indication whether the light source complies with the UV-radiation requirements of paragraph M 4.6. of Annex M of this standard, a test report related to paragraph 5.9. of this standard and the objective luminous flux.

2.4.5. In the case, that a distributed lighting system is used, which part(s) is (are) to be intended to provide the front fog beam by this system. In addition, a brief technical specification including the list of the light-guide(s) and related optical components and information describing the light-generator(s) sufficient to permit identification. This information shall include the part number assigned by the light-generator manufacturer, a drawing with dimensions and the basic electrical and photometric values and a test report related to paragraph 5.9. of this standard.

2.4.6. In the case where a gas discharge light source is used:

2.4.6.1. One ballast, which may be totally or partly integrated in the front fog lamp.

2.4.6.2. For approval of a distributed lighting system using a non-replaceable gas-discharge light source not approved under standard AIS-034(Part 2)(Rev. 1) two samples of the system including the light-generator and one ballast of each type to be used, where applicable.
2.4.7. In the case of LED module(s) or a distributed lighting system and if no provisions are taken to shield the relevant front fog lamp or distributed lighting system components made of plastic material from UV-radiation of (gas-discharge) light sources, e.g. by UV-retaining glass filters:

One sample of each of the relevant materials. This shall have similar geometry to that of the front fog lamp or distributed lighting system being tested. Each material sample shall have the same appearance and surface treatment, if any, as intended for use in the front fog lamp to be approved.

2.4.8. In the case of an approval of a front fog lamp according to paragraph 2.4.8. and/or according to paragraph 5.9. containing plastic lenses and/or having inner optical parts made from plastic, which have already been tested:

The materials making up the lenses, coatings or optical inner parts, if any, shall be accompanied by the test report(s) on material testing against UV-radiation.

2.4.9. Two samples of each type of front fog lamp, one sample intended for the installation on the left side of the vehicle and one sample intended for the installation on the right side of the vehicle; or a matched pair of front fog lamps.

2.4.10. One light source control gear, if applicable.

2.4.11. One variable intensity control or a generator providing the same signals, if applicable.

2.5. Reserved

3. MARKINGS

3.1. The samples of a type of front fog lamp or distributed lighting system which are submitted for approval shall clearly, legibly and indelibly bear:

(a) the trade name or mark of the lamp manufacturer,

(b) marking indicating the class of the front fog lamp, and in case of Class F3 front fog lamps:

(c) the LED module or light generator specific identification code, if any.

3.2. They shall comprise, on the lens and on the main body \(1/\), spaces of sufficient size for the approval markings as per AIS-037 and the additional symbols referred to in paragraph 3. These spaces shall be indicated on the drawings referred to in paragraph 2.2.1.

\(1/\) If the lens cannot be detached from the main body of the front fog lamp, a space on the lens or body shall be sufficient.
3.3. The approval marking shall be placed on an inner or outer part (transparent or not) of the device which can not be separated from the transparent part of the device emitting light; in the case of a distributed lighting system with outer lens built in the light-guide, this condition is deemed satisfied if the approval marking is placed at least on the light-generator and on the light-guide or on its protective shield. In any case the marking shall be visible when the device is fitted on the vehicle, at least when a movable part such as the hood or boot lid or a door is opened.

3.4. In case of Class F3 front fog lamps:

3.4.1. In case of a distributed lighting system, the light-generator(s) shall bear the marking of the rated voltage and wattage and in the case that the electronic control gear is not part of the device the light-generator(s) shall bear the trade name or mark of its manufacturer and the part number.

3.4.2. In case of lamps with LED module(s) the lamp shall bear the marking of the rated voltage, rated wattage and the light source module specific identification code.

3.5. The LED module(s) submitted along with the application for approval of the lamp:

3.5.1. shall bear the trade name or mark of the applicant; this marking shall be clearly legible and indelible;

3.5.2. shall bear the specific identification code of the module; this marking shall be clearly legible and indelible.

The specific identification code shall comprise the starting letters "MD" for "Module". This specific identification code shall be shown in the drawings mentioned in paragraph 2.2.1. and in the case where several non identical LED modules are used, followed by additional symbols or characters. The approval marking does not have to be the same as the one on the lamp in which the module is used, but both markings shall be from the same applicant.

3.6. If a light source control gear is used, which is not part of the LED module it shall be marked with the specific identification code (s), the rated input voltage and wattage.

3.7. On the prototype for type approval, the markings may be provided by suitable temporary methods and need not necessary be obtained from the tools used for series production.
4. APPROVAL

4.1. General

4.1.1. If all the samples of a type of front fog lamp submitted in pursuance of paragraph 2. Satisfy the provisions of this standard, approval shall be granted.

4.1.2. Where grouped, combined or reciprocally incorporated lamps have been found to comply with the requirements of several standards, a single approval mark may be applied provided that each of the grouped, combined or reciprocally incorporated lamps satisfies the provisions applicable to it.

4.1.3. Type approval number shall be assigned to each type approved.

4.1.4. Reserved.

4.1.5. Reserved.

4.2. Composition of the approval mark

The approval mark shall consist of:

4.2.1. Reserved

4.2.2. the following additional symbol (or symbols):

4.2.2.1. on front fog lamps meeting the requirements of this standard, in the case of:

(a) Class B; the letter "B"
(b) Class F3; the symbol "F3"

4.2.2.2. on front fog lamps incorporating a lens of plastic material the group of letters "PL" to be affixed near the symbols prescribed in paragraph 4.2.2.1.;

4.2.2.3. In every case the relevant operating mode used during the test procedure according to paragraph E1.1.1. of Annex E and the permitted voltages according to paragraph E1.1.2. of Annex E shall be stipulated.

In the corresponding cases the device shall be marked as follows:

4.2.2.3.1. on units meeting the requirements of this standard which are so designed that the filament(s) of one function shall not be lit simultaneously with that of any function with which it may be reciprocally incorporated, an oblique stroke (/) shall be placed behind the symbol in the approval mark of such function.
4.2.2.3.2. However, if only the front fog lamp and the passing lamp shall not be lit simultaneously, the oblique stroke shall be placed behind the fog lamp symbol, this symbol being placed either separately or at the end of a combination of symbols.

4.2.2.3.3. On units meeting the requirements of Annex E to this standard only when supplied with a voltage of 6 V or 12 V, a symbol consisting of the number 24 crossed out by an oblique cross (x) shall be placed near the filament lamp holder.

4.2.2.4. The reciprocal lamp incorporation of passing beam lamp and front fog lamp is possible if it is in compliance with AIS-008(Rev. 1);

4.2.2.5. Front fog lamps of Class F3 having asymmetric light distribution and which shall not be indiscriminately mounted on either side of the vehicle, shall bear an arrow pointing to the outside of the vehicle.

4.2.2.6. Reserved

4.2.2.7. The symbols referred to in paragraph 4.2.2. shall be clearly legible and be indelible even when the front fog lamp is fitted in the vehicle.

4.3. Arrangement of the approval mark

4.3.1. Reserved

4.3.2. Grouped, combined or reciprocally incorporated lamps

4.3.2.1. Reserved

4.3.2.1.1. it is visible after their installation;

4.3.2.2.2. or in a group, in such a way that each of the grouped, combined or reciprocally incorporated lamps may be clearly identified.

4.3.2.3. Reserved

4.3.2.4. Reserved.

4.3.2.5. Reserved.

4.3.3. In the case of lamps, the lens of which are used for different types of front fog lamps and which may be reciprocally incorporated or grouped with other lamps, the provisions in paragraph 4.3.2. are applicable.
4.3.3.1. In addition, where the same lens is used for different types of lamps, it may bear the different approval marks relating to the different types of front fog lamps or units of lamps, provided that the main body of the front fog lamp, even if it cannot be separated from the lens, also comprises the space described in paragraph 3.2. and bears the approval marks of the actual functions.

If different types of front fog lamps comprise the same main body, the latter may bear the different approval marks.

4.3.3.2. Reserved.

5. GENERAL SPECIFICATIONS

5.1. Each sample of front fog lamp submitted in conformity with paragraph 2.2. shall meet the specifications set forth in paragraphs 6. and 7. of this standard.

5.2. The front fog lamps shall be so designed and constructed that in normal use, despite the vibrations to which they may then be subjected, their satisfactory operation continues to be ensured and they retain the characteristics prescribed by this standard. The correct position of the lens shall be clearly marked and the lens and reflector shall be so secured as to prevent any rotation during use. Conformity with the requirements of this paragraph shall be verified by visual inspection and, where necessary, by a trial fitting.

5.2.1. Front fog lamps shall be fitted with a device enabling them to be so adjusted on the vehicles as to comply with the rules applicable to them. Such a device need not be fitted on units in which the reflector and the lens cannot be separated, provided the use of such units is confined to vehicles on which the front fog lamp setting can be adjusted by other means. Where a front fog lamp and another front lamp, each equipped with its own light source, are assembled to form a composite unit, the adjusting device shall enable each optical system to be individually adjusted.

5.2.2. These provisions shall not apply to front lamp assemblies whose reflectors are indivisible. For this type of assembly the requirements of paragraph 6.3.4. or 6.4.3. (as appropriate) shall apply.

5.3. Complementary tests shall be carried out according to the requirements of Annex E to ensure that in use there is no excessive change in photometric performance.

5.4. If the lens of the front fog lamp is of plastic material, tests shall be carried out according to the requirements of Annex F.

5.5. In the case of the use of replaceable light sources:

(a) the light source's holder shall conform to the characteristics given in IEC Publication No. 60061. The holder data sheet relevant to the category of light sources used applies;

(b) the light source shall fit easily into the front fog lamp;
(c) the design of the device shall be such that the light source(s) can be fixed in no other position but the correct one.

5.6. In the case of Class B, the front fog lamp shall be equipped with one filament lamp approved according to AIS-034(Part 1)(Rev. 1) even if the filament lamp cannot be replaced. Any AIS-034 (Part 1) (Rev. 1) filament lamp may be used, provided that no restriction on the use is made in AIS-034 (Part 1)(Rev. 1) and its amendments in force at the time of application for type approval.

5.6.1. Even if this filament lamp cannot be replaced it shall comply with the requirements in paragraph 5.6.

5.7. In the case of Class F3, the light sources shall be:

5.7.1. one or more replaceable light sources approved according to AIS-034 (Part 1 or 2)(Rev. 1) and their amendments in force at the time of application for type approval.

5.7.2. and/or, one or more LED modules where the requirements of Annex M to this standard shall apply. The compliance with the requirements shall be tested.

5.7.3. and/or light generators where the requirements of Annex M to this standard shall apply. The compliance with the requirements shall be tested.

5.8. Even if these light sources cannot be replaced they shall comply with the requirements in paragraph 5.7.

5.9. In the case of LED module or light generator it shall be checked, that:

5.9.1. the design of the LED module(s) or light generator(s) shall be such that they can be fitted in no position other than the correct one.

5.9.2. non-identical light source modules, if any, shall be non-interchangeable within the same lamp housing.

5.9.3. the LED module(s) or light generator(s) shall be tamperproof.

5.10. In case of front fog lamps with light source(s) having a total objective luminous flux that exceeds 2,000 lumen, a reference shall be made in paragraph A 9.10. of the communication form in Annex A.

5.11. If the lens of the front fog lamp is made of plastic material tests shall be done according to the requirements in Annex F.

5.11.1. The UV resistance of light transmitting components located inside the front fog lamp and made of plastic material shall be tested according to Annex F, paragraph F 2.7.
5.11.2. The test in paragraph 5.11.1. is not necessary if low-UV type light sources as specified in AIS-034 (Part 2)(Rev. 1) or in Annex M of this standard are used, or if provisions are taken, to shield the relevant lamp components from UV radiation, e.g. by glass filters.

5.12. The front fog lamp and its ballast system or light source control gear shall not generate radiated or power line disturbances, which cause a malfunction of other electric/electronic systems of the vehicle.1/ 

5.13. Front fog lamps, designed to operate permanently with an additional system to control the intensity of the light emitted, or which are reciprocally incorporated with another function, using a common light source, and designed to operate permanently with an additional system to control the intensity of the light emitted, are permitted.

5.14. In the case of Class F3 the sharpness and linearity of the cut-off shall be tested according to the requirements of Annex J.

6. ILLUMINATION

6.1. Front fog lamps shall be so designed as to provide illumination with limited dazzle.

6.2. The luminous intensity produced by the front fog lamp shall be measured at 25 m distance by means of a photoelectric cell having a useful area comprised within a square of 65 mm side. The point HV is the centre-point of the coordinate system with a vertical polar axis. Line h is the horizontal through HV (see Annex D to this standard).

6.3. In the case of Class B front fog lamps:

6.3.1. A colourless standard (etalon) filament lamp shall be used.

6.3.1.1. During the testing of the front fog lamp the power supply for this filament lamp shall be regulated so as to obtain the reference luminous flux as indicated in the relevant data sheet of AIS-034 (Part 1)(Rev. 1).

6.3.1.2. During the testing of a front fog lamp where the filament lamp cannot be replaced, the voltage at the terminals of the front fog lamp shall be regulated at 12.0 V.

6.3.2. The front fog lamp shall be deemed satisfactory if the photometric requirements are met with at least one standard filament lamp.

6.3.3. The aiming screen for visual adjustment (see Annex D to this standard) shall be positioned at either a distance of 10 m or a distance of 25 m in front of the front fog lamp.

1/ Compliance with the requirements for electromagnetic compatibility is relevant to the vehicle type.
6.3.1. The beam shall produce on this aiming screen, over a width of not less than 5.0° on both sides of the line v, a symmetrical and substantially horizontal cut-off to enable visual vertical adjustment.

6.3.2. The front fog lamp shall be so adjusted that the cut-off on the aiming-screen is 1.15° below the line h.

6.3.4. When so adjusted, the front fog lamp shall meet the requirements in paragraph 6.3.5.

6.3.5. The illumination (see Annex D, paragraph D2.1.) shall meet the following requirements:

<table>
<thead>
<tr>
<th>Designated lines or zones</th>

<td>At least one point on each vertical line</td>
</tr>
</tbody>
</table>

*/ The co-ordinates are specified in degrees for an angular web with a vertical polar axis.

The illumination shall be measured in either white or selective yellow light as prescribed by the manufacturer for use of the front fog lamp in normal service.

Variations detrimental to satisfactory visibility in either of the Zones B and C are not permitted.

6.3.6. In the light-distribution as specified in the table in paragraph 6.3.5., single narrow spots or stripes inside the area above 15° with not more than 160 cd are allowed, if not extending beyond a conical angle of 2° aperture or a width of 1°. If multiple spots or stripes are present they shall be separated by a minimum angle of 10°.

6.4. In the case of Class F3 front fog lamps

6.4.1. Depending on the light source, the following conditions shall apply.

6.4.1.1. In the case of replaceable filament light sources:
6.4.1.1. The front fog lamp shall comply with the requirements of paragraph 6.4.3. of this standard with at least one complete set of appropriate standard (etalon) lamps.

In the case of filament lamps operating directly under vehicle voltage system conditions:

The front fog lamp shall be checked by means of colourless standard (etalon) filament lamps.

During the testing of the front fog lamp, the power supply to the filament lamp(s) shall be regulated so as to obtain the reference luminous flux as indicated on the relevant data sheet of AIS-034 (Part 1)(Rev. 1).

6.4.1.2. In the case of a system that uses a light source control gear being part of the lamp, the voltage declared by the applicant shall be applied to the input terminals of that lamp. The measured photometric value shall be multiplied by a factor of 0.7 prior to checking for compliance.

6.4.1.3. In the case of a system that uses a light source control gear not being part of the lamp the voltage declared by the applicant shall be applied to the input terminals of that light source control gear. The test laboratory shall require from the applicant the special light source control gear needed to supply the light source and the applicable functions. The identification of that light source control gear if applicable and/or the voltage applied including the tolerances shall be noted in the communication form in Annex A of this standard. The measured photometric value shall be multiplied by a factor of 0.7 prior to checking for compliance.

6.4.1.2. In the case of a gas-discharge light source:

A standard light source shall be used, which has been aged during at least 15 cycles, in accordance AIS-034 (Part 2)(Rev. 1).

During testing of the front fog lamp the voltage at the terminals of the ballast shall be regulated to maintain 13.5 V for a 12 V system, or at the vehicle voltage as specified by the applicant, with a tolerance of ± 0.1 V.

The measured luminous intensity values shall be multiplied by a factor of 0.7 prior to the check for compliance.

The objective luminous flux of the gas- discharge light source may differ from that specified in AIS-034 (Part 2) (Rev. 1). In this case, the luminous intensity values shall be corrected accordingly.

6.4.1.3. In the case of non-replaceable light sources:

All measurements on front fog lamps equipped with non-replaceable light sources shall be made at 6.3 V, 13.2 V or 28.0 V or at other vehicle voltage as specified by the applicant. The test laboratory may require from the applicant the special power supply needed to supply the light sources.
The test voltages shall be applied to the input terminals of the lamp. The measured luminous intensity values shall be multiplied by a factor of 0.7 prior to checking for compliance.

6.4.1.4. In the case of LED modules:

All measurements on front fog lamps equipped with LED module(s) shall be made at 6.3 V, 13.2 V or 28.0 V respectively, if not otherwise specified within this standard. LED modules operated by an electronic light source control gear shall be measured as specified by the applicant.

The measured luminous intensity values shall be multiplied by a factor 0.7 prior to the check for compliance.

6.4.1.5. Compliance with the requirement in paragraph 5.9.1. shall be verified at least with respect to the values in line 3 and 4 of table in paragraph 6.4.3.

6.4.2. Photometric adjustment and measuring conditions:

6.4.2.1. The aiming screen for visual adjustment (see Annex D paragraph D2.2.) shall be positioned at either a distance of 10 m or a distance of 25 m in front of the front fog lamp.

6.4.2.2. The beam shall produce on this aiming screen, over a width of not less than 5.0° on both sides of the line v, a symmetrical and substantially horizontal cut-off to enable visual vertical adjustment. In the case that visual aim leads to problems or ambiguous positions, the instrumental method as specified in paragraph J.5. of Annex J shall be applied following a confirmation of the cut-off quality as described in paragraph 6.4.2.3.

6.4.2.3. The sharpness of the cut-off shall be tested according to the requirements in paragraph J 4.1.2. of Annex J. The value of G shall not be less than 0.08.

The linearity of the cut-off shall be tested according to the requirements in paragraph J 4.1.3. of Annex J and the part of the cut-off line serving for vertical adjustment shall be horizontal from 3° left to 3° right of the v-v line. The linearity is considered to be satisfactory if the vertical positions of the inflection points determined according to the method described in paragraph J 3.2. of Annex J at 3° left and right of the v-v line do not deviate by more than ± 0.20°.

6.4.2.4. The front fog lamp shall be adjusted so that the cut-off on the screen is 1° below the line h according to the requirements in paragraph J 2. of Annex J.
6.4.3. Photometric requirements

When so adjusted, the front fog lamp shall meet the photometric requirements in the table below (refer also to Annex D, paragraph D 2.2. of this standard):

<table>
<thead>
<tr>

</table>

*/ The co-ordinates are specified in degrees for an angular web with a vertical polar axis.

**/ See paragraph 6.4.3.4.

***/ See paragraph 6.4.3.2.

6.4.3.1. The illumination shall be measured either with white light or coloured light as prescribed by the applicant for use of the fog lamp in normal service. Variations in homogeneity detrimental to satisfactory visibility in the zone above the line 5 from 10 degrees left to 10 degrees right are not permitted.

6.4.3.2. At the request of the applicant, two front fog lamps constituting a matched pair corresponding to paragraph 4.2.2.5. may be tested separately. In this case the specified requirements for lines 8 and 9 in the table in paragraph 6.4.3. apply to half the sum of readings of the right-hand and left-hand side front fog lamp.

6.4.3.3. Inside the field between lines 1 to 5 in Figure 3 of Annex D, the beam pattern should be substantially uniform. Discontinuities in intensities detrimental to satisfactory visibility between the lines 6, 7, 8 and 9 are not permitted.
6.4.3.4. In the light-distribution as specified in the table in paragraph 6.4.3., single narrow spots or stripes inside the area including the measuring points 1 to 10 and line 1 or inside the area of line 1 and line 2 with not more than 120 cd are allowed, if not extending beyond a conical angle of 2° aperture or a width of 1°. If multiple spots or stripes are present they shall be separated by a minimum angle of 10°.

6.4.3.5. If the specified luminous intensity requirements are not met, a re-aim of the cut-off position within + 0,5° vertical and/or + 2° horizontal is allowed. In the re-aimed position all photometric requirements shall be met.

6.4.4. Other photometric requirements

6.4.4.1. In the case of front fog lamps equipped with gas-discharge light sources the luminous intensity shall exceed 800 cd in the measuring point at 0° horizontal and 2° D vertical, four seconds after activation of the fog lamp which has not been operated for 30 minutes or more.

6.4.4.2. To adapt to dense fog or similar conditions of reduced visibility, it is permitted to automatically vary the luminous intensities provided that:

(a) an active electronic light source control gear is incorporated into the front fog lamp function system.

(b) all intensities are varied proportionately.

The system, when checked for compliance according to the provisions of paragraph 6.4.1.2., is considered acceptable if the luminous intensities remain within 60 per cent and 100 per cent of the values specified in the table in paragraph 6.4.3.

6.4.4.2.1. An indication shall be inserted in the communication form (Annex A, paragraph A10.).

6.4.4.2.2. The testing agency responsible for type approval shall verify that the system provides automatic modifications, such that good road illumination is achieved and no discomfort is caused to the driver or to other road users.

6.4.4.2.3. Photometric measurements shall be performed according to the applicant's description.

7. COLOUR OF LIGHT EMITTED

The colour of the light emitted by the front fog lamp shall be either white or selective yellow as per AIS-010 (Part 5)(Rev. 1). The selective yellow colour, if any, of the beam may be obtained either by the colour of the light source or by the lens of the front fog lamp or by any other suitable means.

7.1. The colorimetric characteristics of the front fog lamp shall be measured with voltages as defined in paragraphs 6.3. and 6.4.
8. **DETERMINATION OF DISCOMFORT (DAZZLE)**

Reserved

9. **MODIFICATIONS OF THE TYPE OF FRONT FOG LAMP AND EXTENSION OF APPROVAL**

9.1 Every modification pertaining to the information, even if the changes are not technical in nature declared in accordance with 2 shall be intimated by the manufacturer to the testing agency.

If the changes are in parameters not related to the provisions, no further action need be taken.

If the changes are in parameters related to the provisions, the testing agency, which has issued the certificate of compliance, shall then consider, whether,

9.1.1 The device with the changed specifications still complies with provisions, or

9.1.2 Any further verification is required to establish compliance.

9.2 For considering whether testing is required or not, guidelines given in 9.5 (Criteria for Extension of Approval) shall be used.

9.3 In case of 9.1.2, tests for only those parameters which are affected by the modifications need be carried out.

9.4 In case of fulfilment of criterion of 9.1.1 or after results of further verification as per 9.1.2 are satisfactory, the approval of compliance shall be extended for the changes carried out.

9.5 **Criteria for extension of approval**

The Criteria shall be as agreed between the testing agency and applicant.

10. **CONFORMITY OF PRODUCTION**

10.1. Every device bearing an approval mark as prescribed under this standard shall Conform to the type approved and shall comply with the requirements of this standard. However, in the case of a device picked at random from series production, the requirements as to the respectively, minimum and maximum intensities of the light emitted (measured with a standard filament lamp as referred to in 8. above) shall be at least 80 per cent of the minimum values specified and not exceed 120 per cent of the Maximum values allowed.

10.2. Reserved

10.3. The conformity of production procedures shall comply with those set out in the AIS-037 with the following requirements
10.3.1. During the verification as per 10.3, the tests prescribed in Annex F to this standard with the tolerances as prescribed in Annex B of this standard are carried out:

10.3.2. Reserved clauses to 10.3.6.

10.4. Reserved

10.4.1. Devices with apparent defects are disregarded.

10.4.2. The reference mark is disregarded

10.4.3. Reserved

10.4.4. Reserved

10.4.5. Reserved

10.5. The normal frequency of these verifications shall be once every two years.

11. PENALTIES FOR NON-CONFORMITY OF PRODUCTION

11.1. Penalties for non-conformity of production shall be as prescribed in AIS-037

11.2. Reserved.

12. Reserved

13. Reserved

14. TRANSITIONAL PROVISION

14.1 At the request of the applicant, type approvals for compliance to AIS-012 (Part 1) (Rev.1): 2011 shall be granted by testing agencies from 22nd February 2011 (date of adoption of this standard in CMVR-TSC). Such type approvals shall be deemed to be compliance to Annex C1, C2, C3 of AIS-012:2004.

14.2 At the request of applicant, type approval to the compliance to Annex C1, C2, C3 of AIS-012: 2004 shall be granted up to the notified date of implementation of AIS-012 (Part 1) (Rev.1):2011.

14.3 Type approvals issued for compliance to Annex C1, C2, C3 of AIS-012: 2004 shall be extended to approval of AIS-012 (Part 1) (Rev.1):2011 subject to satisfactory compliance of the following:

14.3.1 Marking as per 3.0 applicable for marking.

14.3.2 In case of “E/e” approved devices, requirements specified in 15.
14.3.3 In the case of front fog lamps of classes B or F3 the photometric requirements, in particular those prescribed in clause no. 6 of this standard.

Note: Additional verification for the above need not be carried out, if compliance to the above requirements has already been established during the type approval as per Annex C1, C2, C3 of AIS-012:2004.

14.4 Extension of Approvals for engineering and administrative changes:

14.4.1 In the case of 14.1, extensions shall be granted subject to the conditions of AIS-012(Part 1) (Rev.1):2011. Such extensions shall be deemed to be compliance to AIS-012:2004.

14.4.2 In the case of 14.2, extensions shall be granted subject to conditions of AIS-012:2004 till the notified date of implementation of AIS-012 (Part 1) (Rev.1):2011.

14.5 Type approvals for compliance to AIS-037, already been granted, shall continue to be valid for AIS-012 (Part 1) (Rev.1):2011.

15. ESTABLISHING COMPLIANCE OF “E”/“e” APPROVED FRONT FOG LAMPS TO THIS STANDARD

15.1 As an exception to 7.4 of AIS-037, (or related administrative decisions) for certifying compliance of “E”/“e” approved rear fog lamps to this standard, the test for the following shall be carried out by testing agency

15.1.1 Photometric requirements measured with a standard filament lamp as referred above shall be at least 80 per cent of the minimum values and shall not exceed 120 per cent of the maximum values specified in 6.0.

15.1.2 Colorimetric requirements shall be specified in 7.0 within the limits specified

16. AMENDMENTS TO ECE REGULATIONS AFTER THE LEVEL DESCRIBED IN 0.3 OF INTRODUCTION

16.1 Supplements

Note: In case of changes in ECE regulation, which are issued as supplements (Supplements do not affect the earlier type approvals) at the request of applicant, approval of compliance to this standard shall be issued taking into account the changes arising out of such supplement(s) to ECE regulation with approval from Chairman AISC.

This shall be incorporated in the test report.

Such changes will be considered for inclusion in this standard at the time of its next amendment /revision.
16.2 Series of amendments

Changes in ECE regulation, which are issued as series of amendments (series of amendments may affect the earlier type approvals) will not be considered for issuing approval to this standard.

However, Chairman, AISC may, on a case to case basis, permit to accept latest series of amendments.

This shall be incorporated in the test report.

Note: Such changes will be considered for inclusion in this standard at the time of its next revision.
ANNEX A
(See 2.1)

APPLICATION FOR APPROVAL
Technical information to be submitted by the Applicant at the time of Approval

A 1 Details of the applicant
A 1.1 Trade name or mark of the device
A 1.2 Manufacturer's name for the type of device
A 1.3 Manufacturer's name and address
A 1.4 Telephone No
A 1.5 FAX. No.
A 1.6 E mail address
A 1.7 Contact person
A 1.8 If applicable, name and address of manufacturer's representative:

A 2 Plant/(s) of manufacture.

A 3 A brief description giving the technical specifications of the materials of which the front fog lamp is made;

A 4 Drawings, in triplicate, in sufficient detail to permit identification of the type, showing geometrically the position(s) in which the front fog lamp may be fitted to the vehicle, and in case of Class B or F3 details of installation. The drawings shall show the position intended for the approval number and class.

A 5 Colour of light emitted: white/ Selective yellow

A 6 Installation as an individual set of lamps which is installed on the body of a vehicle: yes/no

A 7 Geometric conditions of installation and relating variations, if any

A 8 No of samples submitted for each class:

A 9 Category of filament lamp:
A 9.1 LED module :yes/no
A 9.2 Light Generator :yes/no
A 9.3 LED module or light generator specific identification code
A 9.4 Application of electronic light source control gear : yes/ no
A 9.5 Supply to the light source:
A 9.6  Specification of the light source control gear:

A 9.7  Input voltage :

A 9.8  In the case of an electronic light source control gear not being part of the lamp:

A 9.9  Output signal specification

A 9.10 Luminous flux of the light source (see 5.10)
       Greater than 2000 lumen : yes / no

A 9.11 Luminous intensity is variable : yes / no

A 9.12 The determination of the cut-off gradient (if measured) was carried out at :
       10M / 25M
ANNEX B
(See 10.3.1)

TOLERANCE REQUIREMENTS FOR CONFORMITY OF PRODUCTION CONTROL PROCEDURE

B1. In the case of class B front fog lamps:

B1.1. When testing photometric performances of any front fog lamp chosen at random and equipped with a standard filament lamp, no measured value may deviate unfavourably by more than 20 per cent from the value prescribed in this standard.

B1.2. For the periodic records, the reading is limited to points B50 1/ and left and right bottom corners of zone D (see Figure 2 in Annex D).

B 2. In the case of class F3 front fog lamps:

B 2.1. when testing the photometric performances of any front fog lamp chosen at random according to paragraph 6.4. of this standard, no measured value of the luminous intensity may deviate unfavourably by more than 20 per cent.

B 2.2. for the measured values in the table according to paragraph 6.4.3. of this standard the respective maximum deviations may be:

<table>

B 2.3. For the periodic records, the photometric measurements for verification of conformity shall at least yield data for the points 8 and 9, the maximum value on lines 1, 5, and the minimum value on line 6, 8 and 9 as specified in paragraph 6.4.3. of this standard.
ANNEX C
(Reserved)
ANNEX D
(See 6.2)

MEASURING SCREEN GEOMETRY AND MEASURING GRID

D1. MEASURING SCREEN

The co-ordinates are specified in degrees for spherical angles in a web with a vertical polar axis (see Figure 1).

According to CIE standards:
- \( h \) : longitudinal planes around the polar axis
- \( v \) : latitudinal planes perpendicular to the polar axis

Figure 1
D 2. MEASURING GRID (see Figure 2)

The measuring grid is symmetrical about the v-v line (see table in paragraph 6.4.3. of this standard). For simplicity the angular web is shown in the form of a rectangular grid.

D 2.1. In the case of front fog lamps of Class "B", the measuring grid is shown in Figure 2.

Figure 2
Light distribution of the Class B front fog lamp
D 2.2. In the case of front fog lamps of Class "F3", the measuring grid is shown in Figure 3.

Figure 3
Light distribution of the Class F3 front fog lamp
ANNEX E
(See 4.2.2.3)

TESTS FOR STABILITY OF PHOTOMETRIC PERFORMANCE OF FRONT FOG LAMPS IN OPERATION
(TESTS ON COMPLETE FRONT FOG LAMPS)

Once the photometric values have been measured according to the prescriptions of this standard, in the point of maximum illumination in zone D ($E_{max}$) and in the point HV, a complete front fog lamp sample shall be tested for stability of photometric performance in operation. "Complete front fog lamp" is the complete lamp itself including those surrounding body parts and lamps, which could influence its thermal dissipation.

E1. TEST FOR STABILITY OF PHOTOMETRIC PERFORMANCE

The tests shall be carried out in a dry and still atmosphere at an ambient temperature of 23 °C ± 5 °C, the complete front fog lamp being mounted on a base representing the correct installation on the vehicle.

E1.1. Clean front fog lamp

The front fog lamp shall be operated for 12 hours as described in paragraph E1.1.1. and checked as prescribed in paragraph E1.1.2.

E1.1.1. Test procedure

The front fog lamp shall be operated as follows:

E1.1.1.1. in the case where only one lighting function (front fog lamp) is to be approved, the corresponding light source is lit for the prescribed time, 1/

E1.1.1.2. in the case of more than one lighting function (e.g. a headlamp with one or more driving beams and/or a front fog lamp): the headlamp shall be subjected to the following cycle until the prescribed time is reached:

(a) 15 minutes, front fog lamp lit;
(b) 5 minutes, all filaments lit.

If the applicant declares that only one lighting function is to be used at a time (e.g. only the passing beam lit or only the driving beam(s) lit or only the front fog lamp lit 1/), the test shall be carried out in accordance with this condition, successively activating the front fog lamp half of the time and one of the other lighting functions for half the time specified in paragraph E1.1.

1/ When the tested front fog lamp includes signalling lamps, the latter shall be lit for the duration of the test, except for a daytime running lamp. In the case of a direction indicator lamp, it shall be lit in flashing operation mode with an on/ off time ratio of approximately one to one.
E 1.1.3. In the case of front fog lamp with a passing beam and one or more lighting functions (one of them is a front fog lamp):

(a) the front fog lamp shall be subjected to the following cycle until the time specified is reached:

(i) 15 minutes, passing-beam light source(s) lit;
(ii) 5 minutes, all light source(s) lit.

(b) if the applicant declares that the front fog lamp is to be used with only the passing beam lit or only the front fog lamp lit at a time, the test shall be carried out in accordance with this condition, successively activating the passing beam half of the time and the front fog lamp for half of the time specified in paragraph E1.1. The driving beam(s) is (are) subjected to a cycle of 15 minutes off and 5 minutes lit for half of the time and during the operation of the passing beam;

(c) if the applicant declares that the front fog lamp can be used with only the passing beam or only the driving beam(s) lit or only the front fog lamp lit at a time, the test shall be carried out in accordance with this condition, successively activating the passing beam one third of the time, the driving beam(s) one third of the time and the front fog lamp for one third of the time specified in paragraph E1.1.

E 1.1.2. Test voltage

E 1.1.2.1. The voltage at the terminals of replaceable directly operated filament lamps shall be adjusted so as to supply 90 per cent of the maximum wattage specified in AIS-034 (Part 1) (Rev. 1) for each filament of these lamps.

E 1.1.2.2. For LED module(s) the test conditions set out in paragraph 6.4.1. of this standard shall apply.

E 1.1.2.3. In case of indirectly operated light sources, if the light source control gear is part of the device, the test voltage for the light source control gear is 13.2 ± 0.1 volt for 12 V network system.

E 1.1.2.4. In the case of a system that uses a light source control gear not being part of the lamp the voltage declared by the manufacturer, as used for the photometric testing, shall be applied to the input terminals of that light source control gear. The test laboratory shall require from the manufacturer the special light source control gear needed to supply the light source and the applicable functions.

---

1/ Should two or more lamp filaments be simultaneously lit when headlamp flashing is used, this shall not be considered as being normal use of the filaments simultaneously.

2/ When the tested headlamp includes signalling lamps, the latter shall be lit for the duration of the test. In the case of a direction indicator lamp, it shall be lit in flashing mode with an on/off time of approximately one to one.
E 1.1.3. Test results

E 1.1.3.1. Visual inspection

Once the front fog lamp has been stabilised to the ambient temperature, the front fog lamp lens and the external lens, if any, shall be cleaned with a clean, damp cotton cloth. It shall then be inspected visually; no distortion, deformation, cracking or change in colour of either the front fog lamp lens or the external lens, if any, shall be noticeable.

E 1.1.3.2. Photometric test

To comply with the requirements of this standard, the following photometric values shall be verified in the following points:

In case of Class "B" front fog lamps: at point HV and the point of Imax in zone D.

In case of Class "F3" front fog lamps: on line 5 at point h = 0 and the point of Imax in zone D.

Another aiming may be carried out to allow for any deformation of the front fog lamp base due to heat (the change of the position of the cut-off line is covered in paragraph E2.).

A 10 per cent discrepancy between the photometric characteristics and the values measured prior to the test is permissible including the tolerances of the photometric procedure.

E 1.2. Dirty front fog lamp

The front fog lamp, having been tested as specified in paragraph E1.1 be operated for one hour as described in paragraph E1.1.1. Following preparation as prescribed in paragraph E1.2.1. it shall be checked as prescribed in paragraph E1.1.2.

E 1.2.1. Preparation of the front fog lamp

E 1.2.1.1. Test mixture

E 1.2.1.1.1. For front fog lamps with the outside lens in glass:

The mixture of water and a polluting agent to be applied to the front fog lamp shall be composed of:

(a) 9 parts by weight of silica sand with a particle size of 0-100 µm;

(b) 1 part by weight of vegetal carbon dust (beech wood) with a particle size of 0-100 µm;
(c) 0.2 part by weight of NaCMC \(^1\), and

(d) an appropriate quantity of distilled water, with a conductivity of \(S < 1 \, \mu S/m\).

The mixture shall not be more than 14 days old.

E 1.2.1.1.2. For front fog lamp with outside lens in plastic material:

The mixture of water and polluting agent to be applied to the front fog lamp shall be composed of:

(a) 9 parts by weight of silica sand with a particle size of 0-100 \(\mu m\),

(b) 1 part by weight of vegetal carbon dust (beech wood) with a particle size of 0-100 \(\mu m\),

(c) 0.2 part by weight of NaCMC, \(^1\)

(d) 13 parts by weight of distilled water with a conductivity of \(S < 1 \, \mu S/m\), and

(e) \(\pm 1\) part by weight of surfactant \(^2\)

The mixture shall not be more than 14 days old.

E 1.2.1.2. Application of the test mixture to the front fog lamp

The test mixture shall be uniformly applied to the entire light emitting surface of the front fog lamp and then left to dry. This procedure shall be repeated until the illumination value has dropped to 15-20 per cent of the values measured for the following point under the conditions described in this annex:

point of \(E_{\text{max}}\) in zone D.

E 1.2.1.3. Measuring equipment

The measuring equipment shall be equivalent to that used during front fog lamp approval tests.

In the case of the use of filament lamps, standard (etalon) filament lamps shall be used for the photometric verification.

In the case of the use of gas-discharge light sources, the gas-discharge light source supplied by the applicant shall be used for the photometric verification.

---------------------------------------------------------------

\(^1\) Na CMC represents the sodium salt of carboxymethylcellulose, customarily referred to as CMC. The Na CMC used in the dirt mixture shall have a degree of substitution (DS) of 0.6-0.7 and a viscosity of 200-300 \(\mu P\) for a 2 per cent solution at 20 °C.

\(^2\) The tolerance on quantity is due to the necessity of obtaining a dirt that correctly spreads out on all the plastic lens.
In the case of the use of LED modules, the LED modules supplied by the applicant shall be used for the photometric verification.

E 2. TEST FOR CHANGE IN VERTICAL POSITION OF THE CUT-OFF LINE UNDER THE INFLUENCE OF HEAT

This test consists of verifying that the vertical drift of the cut-off line under the influence of heat does not exceed the specified value for an operating front fog lamp.

The front fog lamp tested in accordance with paragraph E1., shall be subjected to the test described in paragraph E2.1., without being removed from or readjusted in relation to its test fixture.

E 2.1. Test

The test shall be carried out in a dry and still atmosphere at an ambient temperature of 23 °C ± 5 °C.

Using a mass production light source, which has been aged for at least one hour, the front fog lamp shall be operated without being dismounted from or readjusted in relation to its test fixture. (For the purpose of this test, the voltage shall be adjusted as specified in paragraph E1.1.2.).

The position of the cut-off line between a point situated 3.0 degrees left and a point situated 3.0 degrees right of the line VV (see Annex D of the standard) shall be verified after three minutes (r3) and 60 minutes (r60) respectively of operation.

The measurement of the variation in the cut-off line position as described above shall be carried out by any method giving acceptable accuracy and reproducible results.

E 2.2. Test results

E 2.2.1. The result expressed in milliradians (mrad) shall be considered acceptable when the absolute value $\Delta r_I = | r_3 - r_{60} |$ recorded on this front fog lamp is not more than 2 mrad ($\Delta r_I \leq 2 \text{ mrad}$).

E 2.2.2. However, if this value is more than 2 mrad but not more than 3 mrad ($2 \text{ mrad} < \Delta r_I \leq 3 \text{ mrad}$) a second front fog lamp shall be tested as described in paragraph E2.1. This shall be done after the front fog lamp has been subjected to three consecutive cycles as described below, in order to stabilise the position of the mechanical parts of the front fog lamp that is mounted on a base representative of the correct installation on the vehicle:

(a) Operation of the front fog lamp for one hour. (The voltage shall be adjusted as specified in paragraph E1.1.2.).

(b) Period of rest for one hour.

E 2.2.3. The front fog lamp type shall be considered acceptable if the mean value of the absolute values $\Delta r_I$ measured on the first sample and $\Delta r_{II}$ measured on the second sample is not more than 2 mrad.

$$(\Delta r_I + \Delta r_{II}) / 2 \leq 2 \text{ mrad}.$$
ANNEX F

(See 5.4)

REQUIREMENTS FOR LAMPS INCORPORATING LENSES OF PLASTIC MATERIAL – TESTING OF LENS OR MATERIAL SAMPLES AND OF COMPLETE LAMPS

F 1. GENERAL SPECIFICATIONS

F 1.1. The samples supplied pursuant to paragraph 2.2.2. of this standard shall satisfy the specifications indicated in paragraphs F.2.1. to F.2.5.

F 1.2. The two samples of complete lamps supplied pursuant to paragraph 2.3. of this standard (or paragraph 2.4. of this standard as applicable) and incorporating lenses of plastic material shall, with regard to the lens material, satisfy the specifications indicated in paragraph F.2.6.

F 1.3. The samples of lenses of plastic material or samples of material shall be subjected, with the reflector to which they are intended to be fitted (where applicable), to approval tests in the chronological order indicated in table A reproduced in Appendix 1 to this annex.

However, if the lamp manufacturer can prove that the product has already passed the tests prescribed in paragraphs F2.1. to F2.5., or the equivalent tests pursuant to another standard, those tests need not be repeated; only the tests prescribed in Appendix 1, table B, shall be mandatory.

F 2. TESTS

F 2.1. Resistance to temperature changes

F 2.1.1. Tests

Three new samples (lenses) shall be subjected to five cycles of temperature and humidity (RH = relative humidity) change in accordance with the following programme:

- 3 hours at 40 °C ± 2 °C and 85 - 95 per cent RH;
- 1 hour at 23 °C ± 5 °C and 60 - 75 per cent RH;
- 15 hours at – 30 °C ± 2 °C;
- 1 hour at 23 °C ± 5 °C and 60 - 75 per cent RH;
- 3 hours at 80 °C ± 2 °C;
- 1 hour at 23 °C ± 5 °C and 60 - 75 per cent RH;

Before this test, the samples shall be kept at 23 °C ± 5 °C and 60 - 75 per cent RH for at least four hours.
Note: The periods of one hour at 23 °C ± 5 °C shall include the periods of transition from one temperature to another which are needed in order to avoid thermal shock effects.

F 2.1.2. Photometric measurements

F 2.1.2.1. Method

Photometric measurements shall be carried out on the samples before and after the test. These measurements shall be made under the conditions as specified in paragraph 6.3. or 6.4. of this standard, at the following points:

In the case of Class "B" front fog lamps:
(a) at point HV and
(b) point h = 0, v = 2° D in zone D.

In the case of Class "F3" front fog lamps:
(a) intersection VV line with line 6 and
(b) intersection VV line with line 4.

F 2.1.2.2. Results

The variation between the photometric values measured on each sample before and after the test shall not exceed 10 per cent including the tolerances of the photometric procedure.

F 2.2. Resistance to atmospheric and chemical agents

F 2.2.1. Resistance to atmospheric agents

Three new samples (lenses or samples of material) shall be exposed to radiation from a source having a spectral energy distribution similar to that of a black body at a temperature between 5,500 K and 6,000 K. Appropriate filters shall be placed between the source and the samples so as to reduce as far as possible radiations with wavelengths smaller than 295 nm and greater than 2,500 nm. The samples shall be exposed to an energetic illumination of 1,200 W/m² ± 200 W/m² for a period such that the luminous energy that they receive is equal to 4,500 MJ/m² ± 200 MJ/m². Within the enclosure, the temperature measured on the black panel placed on a level with the samples shall be 50 °C ± 5 °C. In order to ensure a regular exposure, the samples shall revolve around the source of radiation at a speed between 1 and 5 1/min.

The samples shall be sprayed with distilled water of conductivity lower than 1 µS/m at a temperature of 23 °C ± 5 °C, in accordance with the following cycle:

- spraying: 5 minutes;
- drying: 25 minutes.
F 2.2.2. Resistance to chemical agents

After the test described in paragraph F.2.2.1. and the measurement described in paragraph F.2.2.3.1. have been carried out, the outer face of the said three samples shall be treated as described in paragraph F.2.2.2. with the mixture defined in paragraph F.2.2.2.1.

F 2.2.2.1. Test mixture

The test mixture shall be composed of 61.5 per cent n-heptane, 12.5 per cent toluene, 7.5 per cent ethyl tetrachloride, 12.5 per cent trichlorethylene and 6 per cent xylene (volume per cent).

F 2.2.2.2. Application of the test mixture

Soak a piece of cotton cloth (as per ISO 105) until saturation with the mixture defined in paragraph F.2.2.2.1. and, within 10 seconds, apply it for 10 minutes to the outer face of the sample at a pressure of 50 N/cm², corresponding to a force of 100 N applied on a test surface of 14 x 14 mm.

During this 10-minute period, the cloth pad shall be soaked again with the mixture so that the composition of the liquid applied is continuously identical with that of the test mixture prescribed.

During the period of application, it is permissible to compensate the pressure applied to the sample in order to prevent it from causing cracks.

F 2.2.2.3. Cleaning

At the end of the application of the test mixture, the samples shall be dried in the open air and then washed with the solution described in paragraph F.2.3. (resistance to detergents) at 23 °C ± 5 °C.

Afterwards the samples shall be carefully rinsed with distilled water containing not more than 0.2 per cent impurities at 23 °C ± 5 °C and then wiped off with a soft cloth.

F 2.2.3. Results

F 2.2.3.1. After the test of resistance to atmospheric agents, the outer face of the samples shall be free from cracks, scratches, chipping and deformation, and the mean variation in transmission

\[ \Delta t = \frac{(T2 - T3)}{T2}, \]

measured on the three samples according to the procedure described in Appendix 2 to this annex shall not exceed 0.020 (\( \Delta t_m \leq 0.020 \)).

F 2.2.3.2. After the test of resistance to chemical agents, the samples shall not bear any traces of chemical staining likely to cause a variation of flux diffusion, whose mean variation

\[ \Delta d = \frac{(T5 - T4)}{T2}, \]
measured on the three samples according to the procedure described in Appendix 2 to this annex shall not exceed 0.020 ($\Delta d_m \leq 0.020$).

F 2.3. **Resistance to detergents and hydrocarbons**

F 2.3.1. Resistance to detergents

The outer face of three samples (lenses or samples of material) shall be heated to $50 \, ^\circ\text{C} \pm 5 \, ^\circ\text{C}$ and then immersed for five minutes in a mixture maintained at $23 \, ^\circ\text{C} \pm 5 \, ^\circ\text{C}$ and composed of 99 parts distilled water containing not more than 0.02 per cent impurities and one part alkylaryl sulphonate.

At the end of the test, the samples shall be dried at $50 \, ^\circ\text{C} \pm 5 \, ^\circ\text{C}$. The surface of the samples shall be cleaned with a moist cloth.

F 2.3.2. Resistance to hydrocarbons

The outer face of these three samples shall then be lightly rubbed for one minute with a cotton cloth soaked in a mixture composed of 70 per cent n-heptane and 30 per cent toluene (volume per cent), and shall then be dried in the open air.

F 2.3.3. Results

After the above two tests have been performed successively, the mean value of the variation in transmission:

$$\Delta t = \frac{(T_2 - T_3)}{T_2}$$

measured on the three samples according to the procedure described in Appendix 2 to this annex shall not exceed 0.010 ($\Delta t_m \leq 0.010$).

F 2.4. **Resistance to mechanical deterioration**

F 2.4.1. Mechanical deterioration method

The outer face of the three new samples (lenses) shall be subjected to the uniform mechanical deterioration test by the method described in Appendix 3 to this annex.

F 2.4.2. Results

After this test, the variations:

in transmission: $\Delta t = \frac{(T_2 - T_3)}{T_2}$

and in diffusion: $\Delta d = \frac{(T_5 - T_4)}{T_2}$

shall be measured according to the procedure described in Appendix 2 in the area specified in paragraph 2.2.4.1.1. The mean value of the three samples shall be such that:

$$\Delta t_m \leq 0.010;$$
$$\Delta d_m \leq 0.050.$$
F 2.5. **Test of adherence of coatings, if any**

F 2.5.1. Preparation of the sample

A surface of 20 mm x 20 mm in area of the coating of a lens shall be grated with a razor blade or a needle into a grid of squares approximately 2 mm x 2 mm. The pressure on the blade or needle shall be sufficient to cut at least the coating.

F 2.5.2. Description of the test

Use an adhesive tape with a force of adhesion of 2 N/(cm of width) ± 20 per cent measured under the standardized conditions specified in Appendix 4 to this annex. This adhesive tape, which shall be at least 25 mm wide, shall be pressed for at least five minutes to the surface prepared as prescribed in paragraph F.2.5.1.

Then the end of the adhesive tape shall be loaded in such a way that a force perpendicular to that surface balances the force of adhesion to the surface considered. At this stage, the tape shall be torn off at a constant speed of 1.5 m/s ± 0.2 m/s.

F 2.5.3. Results

There shall be no appreciable impairment of the grated area. Impairments at the intersections between squares or at the edges of the cuts shall be permitted, provided that the impaired area does not exceed 15 per cent of the grated surface.

F 2.6. **Tests of the complete lamp incorporating a lens of plastic material**

F 2.6.1. Resistance to mechanical deterioration of the lens surface

F 2.6.1.1. Tests

The lens of lamp sample No. 1 shall be subjected to the test described in paragraph F.2.4.1.

F 2.6.1.2. Results

After the test, the results of photometric measurements prescribed in zones A and B for Class B front fog lamp, and lines 2 and 5 for Class F3 front fog lamp shall not exceed the maximum values prescribed by more than 30 per cent.

F 2.6.2. Test of adherence of coatings, if any

The lens of lamp sample No. 2 shall be subjected to the test described in paragraph F.2.5.
F 2.7. **Resistance to light source radiation**

F 2.7.1. In the case of gas-discharge light sources: for testing the resistance of light transmitting components made of plastic materials against UV radiation inside the front fog lamp:

F 2.7.1.1. Flat samples of each light transmitting plastic component of the front fog lamps are exposed to the light of the gas-discharge light source. The parameters such as angles and distances of these samples shall be the same as in the front fog lamp.

F 2.7.1.2. After 1,500 hours of continuous exposure, the colorimetric specifications of the transmitted light shall be met with a new standard gas-discharge light source, and the surface of the samples shall be free of cracks, scratches, scaling or deformation.

F 3. **VERIFICATION OF THE CONFORMITY OF PRODUCTION**

F 3.1. With regard to the materials used for the manufacture of lenses, the lamps of a series shall be recognized as complying with this standard if:

F 3.1.1. After the test for resistance to chemical agents and the test for resistance to detergents and hydrocarbons, the outer face of the samples exhibits no cracks, chipping or deformation visible to the naked eye (see paragraphs F2.2.2., F2.3.1. and F2.3.2.);

F 3.1.2. After the test described in paragraph F2.6.1.1., the photometric values at the points of measurement considered in paragraph F2.6.1.2. are within the limits prescribed for conformity of production by this standard.

F 3.2. If the test results fail to satisfy the requirements, the tests shall be repeated on another sample of front fog lamps selected at random.

ANNEX F - Appendix 2

METHOD OF MEASUREMENT OF THE DIFFUSION AND TRANSMISSION OF LIGHT

1. EQUIPMENT (see figure)

The beam of a collimator K with a half divergence $\beta / 2 = 17.4 \times 10^{-4}$ rd is limited by a diaphragm $D_T$ with an opening of 6 mm against which the sample stand is placed.

A convergent achromatic lens $L_2$, corrected for spherical aberrations, links the diaphragm $D_T$ with the receiver $R$; the diameter of the lens $L_2$ shall be such that it does not diaphragm the light diffused by the sample in a cone with a half top angle of $\beta / 2 = 14^\circ$.

An annular diaphragm $D_D$ with angles $\alpha / 2 = 1^\circ$ and $\alpha_{\text{max}} / 2 = 12^\circ$ is placed in an image focal plane of the lens $L_2$.

The non-transparent central part of the diaphragm is necessary in order to eliminate the light arriving directly from the light source. It shall be possible to remove the central part of the diaphragm from the light beam in such a manner that it returns exactly to its original position.

The distance $L_2 D_T$ and the focal length $F_2$ of the lens $L_2$ shall be so chosen that the image of $D_T$ completely covers the receiver $R$.

When the initial incident flux is referred to 1,000 units, the absolute precision of each reading shall be better than 1 unit.

2. MEASUREMENTS

The following readings shall be taken:

<table>

\(L_2\) For $L_2$ the use a focal distance of about 80 mm is recommended.
ANNEX F - Appendix 3

SPRAY TESTING METHOD

1. TEST EQUIPMENT

1.1. Spray gun

The spray gun used shall be equipped with a nozzle 1.3 mm in diameter allowing a liquid flow rate of 0.24 ± 0.02 l/minute at an operating pressure of 6.0 bars - 0, + 0.5 bar.

Under these operation conditions the fan pattern obtained shall be 170 mm ± 50 mm in diameter on the surface exposed to deterioration, at a distance of 380 mm ± 10 mm from the nozzle.

1.2. Test mixture

The test mixture shall be composed of:

Silica sand of hardness 7 on the Mohs scale, with a grain size between 0 and 0.2 mm and an almost normal distribution, with an angular factor of 1.8 to 2;

Water of hardness not exceeding 205 g/m$^3$ for a mixture comprising 25 g of sand per litre of water.

2. TEST

The outer surface of the lamp lenses shall be subjected once or more than once to the action of the sand jet produced as described above. The jet shall be sprayed almost perpendicular to the surface to be tested.

The deterioration shall be checked by means of one or more samples of glass placed as a reference near the lenses to be tested. The mixture shall be sprayed until the variation in the diffusion of light on the sample or samples measured by the method described in Appendix 2, is such that:

$$\Delta d = \frac{(T5 - T4)}{T2} \leq 0.0250 \pm 0.0025$$

Several reference samples may be used to check that the whole surface to be tested has deteriorated homogeneously.
ANNEX F - Appendix 4

ADHESIVE TAPE ADHERENCE TEST

1. PURPOSE

This method allows the determination under standard conditions of the linear force of adhesion of an adhesive tape to a glass plate.

2. PRINCIPLE

To measure the force necessary to un-stick an adhesive tape from a glass plate at an angle of 90°.

3. SPECIFIED ATMOSPHERIC CONDITIONS

The ambient conditions shall be at 23 °C ± 5 °C and 65 ± 15 per cent relative humidity (RH).

4. TEST PIECES

Before the test, the sample roll of adhesive tape shall be conditioned for 24 hours in the specified atmosphere (see paragraph 3.).

Five test pieces each 400 mm long shall be tested from each roll. These test pieces shall be taken from the roll after the first three turns were discarded.

5. PROCEDURE

The test shall be carried out under the ambient conditions specified in paragraph 3.

Take the five test pieces while unrolling the tape radially at a speed of approximately 300 mm/s and then apply them within 15 seconds in the following manner:

Apply the tape to the glass plate progressively with a slight longitudinal rubbing movement of the finger, without excessive pressure to the tape and to the glass plate.

Leave the assembly in the specified atmospheric conditions for 10 minutes.

Unstuck about 25 mm of the test piece from the plate in a plane perpendicular to the axis of the test piece.

Fix the plate and fold back the free end of the tape at 90°. Apply force in such a manner that the separation line between the tape and the plate is perpendicular to this force and perpendicular to the plate.

Pull to un-stick the tape at a speed of 300 mm/s ± 30 mm/s and record the force required.
6. RESULTS

The five values obtained shall be arranged in order and the median value taken as the result of the measurement. This value shall be expressed in Newton per centimetre of width of the tape.
ANNEX G

MINIMUM REQUIREMENTS FOR CONFORMITY OF PRODUCTION CONTROL PROCEDURE

G1. GENERAL

G1.1. The conformity requirements shall be considered to be satisfied from a mechanical and geometric standpoint, if the differences do not exceed inevitable manufacturing deviations within the requirements of this standard.

G1.2. With respect to photometric performances, the conformity of mass-produced front fog lamps shall not be contested if the photometric performances according to the requirements in Annex B to this standard depending on the prevailing class of front fog lamps are satisfied.

If the results of the tests described above do not meet the requirements, tests on the front fog lamp shall be repeated using light sources as specified in paragraphs 6.3. or 6.4. of this standard, as appropriate.

G1.2.1. If the results of the tests described above do not meet the requirements, the alignment of the front fog lamp may be changed, provided that the axis of the beam is not displaced laterally by more than $0.5^\circ$ to the right or left and not by more than $0.2^\circ$ up or down. In the re-aimed position all photometric requirements shall be met.

G1.3. With respect to the verification of the change in vertical position of the cut-off line under the influence of heat, the following procedure shall be applied:

G1.3.1. One of the sampled front fog lamps shall be tested according to the procedure described in paragraph E2.1. of Annex E after being subjected three consecutive times to the cycle described in paragraph E2.2.2. of Annex E.

G 1.3.2. The front fog lamp shall be considered as acceptable if $\Delta r$ does not exceed 3.0 mrad. If this value exceeds 3.0 mrad but is not more than 4.0 mrad, a second front fog lamp shall be subjected to the test after which the mean of the absolute values recorded on both samples shall not exceed 3.0 mrad.

G 1.4. The chromaticity coordinates shall comply with paragraph 7. of this standard. The photometric performance of a front fog lamp emitting an enlarged selective yellow light when equipped with a colourless light source shall be the values contained in this standard multiplied by 0.84.
G2. MINIMUM REQUIREMENTS FOR VERIFICATION OF CONFORMITY BY THE MANUFACTURER

For each type of front fog lamp the Lamp manufacturer shall carry out at least the following tests, at appropriate intervals. The tests shall be carried out in accordance with the provisions of this standard. If any sampling shows non-conformity with regard to the type of test concerned, further samples shall be taken and tested. The manufacturer shall take steps to ensure the conformity of the production concerned.

G 2.1. Nature of tests

Tests of conformity in this standard shall cover the photometric characteristics and the verification of the change in vertical position of the cut-off line under the influence of heat.

G 2.2. Methods used in tests

G 2.2.1. Tests shall generally be carried out in accordance with the methods set out in this standard.

G 2.2.2. In any test of conformity carried out by the manufacturer, equivalent methods may be used with the consent of the testing agency responsible for approval tests. The manufacturer is responsible for proving that the applied methods are equivalent to those laid down in this standard.

G 2.2.3. The application of paragraphs G2.2.1. and G2.2.2. requires regular calibration of test apparatus and its correlation with measurements made by a testing agency.

G 2.2.4. In all cases the reference methods shall be those of this standard, particularly for the purpose of administrative verification and sampling.

G 2.3. Nature of sampling

Samples of front fog lamps shall be selected at random from the production of a uniform batch. A uniform batch means a set of front fog lamps of the same type, defined according to the production methods of the manufacturer.

The assessment shall in general cover series production from individual factories. However, a manufacturer may group together records concerning the same type from several factories, provided these operate under the same quality system and quality management.

G 2.4. Measured and recorded photometric characteristics

The sampled front fog lamp shall be subjected to photometric measurements at the points provided for in the standard, the reading being limited to points listed in Annex B to this standard depending on the prevailing class of front fog lamps.
G 2.5. **Criteria governing acceptability**

The manufacturer is responsible for carrying out a statistical study of the test results and for defining, in agreement with the testing agency, criteria governing the acceptability of his products in order to meet the specifications laid down for verification of conformity of products as per AIS-037.

The criteria governing the acceptability shall be such that, with a confidence level of 95 per cent, the minimum probability of passing a spot check in accordance with Annex H (first sampling) would be 0.95.
ANNEX H

MINIMUM REQUIREMENTS FOR SAMPLING
BY TESTING AGENCY

H 1. GENERAL

H 1.1 The conformity requirements shall be considered to be satisfied from a mechanical and geometric standpoint, if the differences do not exceed inevitable manufacturing deviations within the requirements of this standard.

H 1.2 With respect to photometric performances, the conformity of mass-produced front fog lamps shall not be contested if the photometric performances according to the requirements in Annex B to this standard depending on the prevailing class of front fog lamps are satisfied.

If the results of the tests described above do not meet the requirements, tests on the front fog lamp shall be repeated using light sources as specified in paragraphs 6.3. or 6.4. of this standard, as appropriate.

H 1.2.1 If the results of the tests described above do not meet the requirements, the alignment of the front fog lamp may be changed, provided that the axis of the beam is not displaced laterally by more than 0.5° to the right or left and not by more than 0.2° up or down. In the re-aimed position all photometric requirements shall be met.

If the specified luminous intensity requirements are not met, a re-aim of the cut-off position within ± 0.5° vertical and/or ± 2° horizontal is allowed. In the re-aimed position all photometric requirements shall be met.

If vertical adjustment cannot be performed repeatedly to the required position within the allowed tolerances, the instrumental method as specified in Annex J to this standard shall be applied and the quality of cut-off be tested on one sample.

H 1.2.2 Front fog lamps with obvious defects are disregarded.

H 1.3 The chromaticity coordinates shall comply with paragraph 7. of this standard. The photometric performance of a front fog lamp emitting an enlarged selective yellow light when equipped with a colourless light source shall be the values contained in this standard multiplied by 0.84.

H 2. FIRST SAMPLING

In the first sampling four front fog lamps shall be selected at random. The first sample of two is marked A, the second sample of two is marked B.
H 2.1. **Conformity is not contested**

H 2.1.1. Following the sampling procedure shown in Figure 1 of this annex the conformity of mass-produced front fog lamps shall not be contested if the deviation of the measured values of the front fog lamps in the unfavourable directions are:

H 2.1.1.1. **sample A**

A1: one front fog lamp not more than 0 per cent
    one front fog lamp not more than 20 per cent

A2: both front fog lamps more than 0 per cent
    but not more than 20 per cent
go to sample B

H 2.1.1.2. **sample B**

B1: both front fog lamps 0 per cent

H 2.2. **Conformity is contested**

H 2.2.1. Following the sampling procedure shown in Figure 1 of this annex the conformity of mass-produced front fog lamps shall be contested and the manufacturer requested to make his production meet the requirements (alignment) if the deviations of the measured values of the front fog lamps are:

H 2.2.1.1. **sample A**

A3: one front fog lamp not more than 20 per cent
    one front fog lamp more than 20 per cent
    but not more than 30 per cent

H 2.2.1.2. **sample B**

B2: in the case of A2
    one front fog lamp more than 0 per cent
    but not more than 20 per cent
    one front fog lamp not more than 20 per cent

B3: in the case of A2
    one front fog lamp more than 20 per cent
    but not more than 30 per cent

H 2.3. **Non conformity established**

Conformity shall be contested and paragraph 11. applied if, following the sampling procedure in Figure 1 of this annex, the deviations of the measured values of the front fog lamps are:
H 2.3.1. sample A

A4: one front fog lamp not more than 20 per cent
    one front fog lamp more than 30 per cent

A5: both front fog lamps more than 20 per cent

H 2.3.2. sample B

B4: in the case of A2
    one front fog lamp more than 0 per cent
    but not more than 20 per cent
    one front fog lamp more than 20 per cent

B5: in the case of A2
    both front fog lamps more than 20 per cent

B6: in the case of A2
    one front fog lamp 0 per cent
    one front fog lamp more than 30 per cent

H 3. REPEATED SAMPLING

In the cases of A3, B2, B3 a repeated sampling, third sample C of two front fog lamps and fourth sample D of two front fog lamps, selected from stock manufactured after alignment, is necessary within two months time after the notification.

H 3.1. Conformity is not contested

H 3.1.1. Following the sampling procedure shown in Figure 1 of this annex the conformity of mass-produced front fog lamps shall not be contested if the deviations of the measured values of the front fog lamps are:

H 3.1.1.1. sample C

C1: one front fog lamp 0 per cent
    one front fog lamp not more than 20 per cent

C2: both front fog lamps more than 0 per cent
    but not more than 20 per cent
    go to sample D

H 3.1.1.2. sample D

D1: in the case of C2
    both front fog lamps 0 per cent
H 3.2. **Conformity is contested**

H 3.2.1. Following the sampling procedure shown in Figure 1 of this annex the conformity of mass-produced front fog lamps shall be contested and the manufacturer requested to make his production meet the requirements (alignment) if the deviations of the measured values of the front fog lamps are:

sample D

D2: in the case of C2

<table>
<thead>
<tr>
<th>one front fog lamp</th>
<th>more than 0 per cent</th>
<th>0 per cent</th>
</tr>
</thead>
<tbody>
<tr>
<td>one front fog lamp</td>
<td>not more than 20 per cent</td>
<td></td>
</tr>
</tbody>
</table>

H 3.3. **Non conformity established**

Conformity shall be contested and paragraph 11. applied if, following the sampling procedure in Figure 1 of this annex, the deviations of the measured values of the front fog lamps are:

H 3.3.1. sample C

C3: one front fog lamp not more than 20 per cent

C4: both front fog lamps more than 20 per cent

H 3.3.2. sample D

D3: in the case of C2

</tr>
</tbody>
</table>

H 4. **CHANGE OF THE VERTICAL POSITION OF THE CUT-OFF LINE**

With respect to the verification of the change in vertical positions of the cut-off line under the influence of heat, the following procedure shall be applied:

One of the front fog lamps of sample A after sampling procedure in Figure 1 of this annex shall be tested according to the procedure described in paragraph D 2.1. of Annex D after being subjected three consecutive times to the cycle described in paragraph D 2.2.2. of Annex D.

The front fog lamp shall be considered as acceptable if $\Delta r$ does not exceed 3.0 mrad.

If this value exceeds 3.0 mrad but is not more than 4.0 mrad, the second front fog lamp of sample A shall be subjected to the test after which the mean of the absolute values recorded in both samples shall not exceed 3.0 mrad.
However, if this value of 3.0 mrad on sample A is not complied with, the two front fog lamps of sample B shall be subjected to the same procedure and the value of $\Delta r$ for each of them shall not exceed 3.0 mrad.

---

**Figure 1**

AIS-012 (Part 1) (Rev.1):2011
ANNEX J

(See 5.14)

DEFINITION AND SHARPNESS OF THE CUT-OFF LINE AND AIMING PROCEDURE BY MEANS OF THIS CUT-OFF LINE FOR CLASS F3 FRONT FOG LAMPS

J 1. GENERAL

The luminous intensity distribution of the front fog lamp shall incorporate a cut-off line that enables the front fog lamp to be adjusted correctly for the photometric measurements and for the aiming on the vehicle. The characteristics of the cut-off line shall comply with the requirements set out in paragraphs J2. to J4.

J 2. SHAPE OF THE CUT-OFF LINE

For visual adjustment of the front fog beam the cut-off line shall provide: a horizontal line for vertical adjustment of the front fog lamp extending to 4° either side of the v-v line (see Figure 1).

![Figure 1: Shape and position of the “cut-off” line](image)

J 3. ADJUSTMENT OF THE FRONT FOG LAMP

J 3.1. Horizontal adjustment

The cut-off line shall be so positioned that the projected beam pattern appears approximately symmetrical to the v-v line. When the front fog lamp is designed for use in pairs or has otherwise an asymmetric beam pattern, it shall be horizontally aligned according to the specification of the applicant, or otherwise in such a way that the cut-off line appears symmetrical to the v-v line.
J 3.2. **Vertical adjustment**

After horizontal adjustment of the front fog beam according to paragraph J3.1., the vertical adjustment shall be performed in such a way that the cut-off line is moved upwards from the lower position until it is situated on the v-v line at 1° below the h-h line. If the horizontal part is not straight but slightly curved or inclined, the cut-off line shall not exceed the vertical range formed by two horizontal lines which are situated between 3° left and right of the v-v line at 0.2° above and below the nominal position of the cut-off (see Figure 1).

J 3.2.1. When the vertical positions of three attempts to adjust the cut-off differ by more than 0.2°, the horizontal part of the cut-off line is assumed not to provide sufficient linearity or sharpness for performing visual adjustment. In this case the quality of cut-off shall be tested instrumentally for compliance with requirements as follows.

**J 4. MEASUREMENT OF THE QUALITY OF CUT-OFF**

J 4.1. Measurements shall be performed by vertically scanning through the horizontal part of the cut-off line in angular steps not exceeding 0.05°

At either a measurement distance of 10 m and a detector with a diameter of approximately 10 mm.

Or at a measurement distance of 25 m and a detector with a diameter of approximately 30 mm.

The measurement of the cut-off quality shall be considered acceptable if the requirements of the paragraphs J 4.1.1. to J 4.1.3. of this annex shall comply with at least one measurement at 10 m or 25 m.

The measuring distance at which the test was determined shall be recorded in paragraph 9. of the communication form in Annex B of this standard.

The scanning is performed from downwards upwards through the cut-off line along the vertical lines at -2.5° and +2.5° from the v-v line. When so measured, the quality of the cut-off line shall meet the following requirements:

J 4.1.1. Not more than one cut-off line shall be visible.

J 4.1.2. Sharpness of cut-off:

If scanned vertically through the horizontal part of the cut-off line along vertical lines at ±1° from the v-v line, the maximum value measured for the sharpness factor G of the cut-off line shall not be less than 0.08 where:

\[ G = (\log E_V - \log E_{(V+0.1°)}) \]
J 4.1.3. Linearity

The part of the cut-off line which serves vertical adjustment shall be horizontal from 3° left to 3° right of the v-v line. This requirement is satisfied, if the vertical positions of the inflection points according to paragraph J3.2. at 3° left and right of the v-v line do not deviate by more than ± 0.20°.

J 5. INSTRUMENTAL VERTICAL ADJUSTMENT

If the cut-off line complies with the above quality requirements, the vertical beam adjustment can be performed instrumentally. For this purpose the inflection point where \( \frac{d^2 (\log E)}{dv^2} = 0 \) is positioned on the v-v line and below the h-h line. The movement for measuring and adjusting the cut-off line shall be upwards from below the nominal position.
ANNEX K

OVERVIEW OF OPERATIONAL PERIODS CONCERNING TEST FOR STABILITY OF PHOTOMETRIC PERFORMANCE

Abbreviations:  
P: passing beam lamp  
D: driving beam lamp (D1 + D2 means two driving beams)  
F: front fog lamp

All following grouped headlamps and front fog lamps together with the added marking symbols are given as examples and are not exhaustive.

---: means a cycle of 15 minutes off and 5 minutes lit.

K 1. P or D or F (HC or HR or B OR F3)

K 2. P+F (HC B OR F3)

K 3. P+F (HC B OR F3/) or HC/B OR F3

ANNEX L

CENTRE OF REFERENCE

Diameter = $a = 2$ mm min.

This optional mark of the centre of reference shall be positioned on the lens at its intersection with the reference axis of the front fog lamp.

The above drawing represents the mark of the centre of reference as projected on a plane substantially tangential to the lens about the centre of the circle. The lines constituting this mark may either be solid or dotted.
ANNEX M
(See 2.4.4)

REQUIREMENTS IN CASE OF USE OF LED MODULES OR OF LIGHT GENERATORS

M 1. GENERAL SPECIFICATIONS

M 1.1. Each LED module or light-generator sample submitted shall conform to the relevant specifications of this standard when tested with the electronic light source control-gear(s) supplied, if any.

M 1.2. LED modules or light-generators shall be so designed as to be, and to remain in good working order when in normal use. They shall moreover exhibit no fault in design or manufacture.

M 1.3. LED modules or light-generators shall be tamperproof.

M 1.4. The design of removable LED modules shall be such that:

M 1.4.1. after removal and replacement of the module the photometric requirements of the headlamp shall still be met;

M 1.4.2. non-identical LED modules within the same lamp housing cannot be interchanged.

M 1.5. In the case of LED modules:

M 1.5.1. the geometric position and dimensions of the elements for optical radiation and shielding, if any, shall be as indicated on the submitted data sheet.

M 1.5.2. the measurement shall be made using optical methods through the transparent envelope, after ageing with the light source supplied by the electronic light source control-gear at test voltage.

M 1.5.3. the position and dimension and transmission of the stripes or shields, if any, shall be as indicated on the submitted data sheet.

M 2. MANUFACTURE

M 2.1. The transparent envelope (e.g. bulb) of the light source shall exhibit no marks or spots, which might impair their efficiency and their optical performance.

M 2.2. In case of LED modules or light-generator(s):

M 2.2.1. the LED(s) on the LED module shall be equipped with suitable fixation elements.
M 2.2.2. the fixation elements shall be strong and firmly secured to the light source(s) and the LED module.

M 2.2.3. the light source in the light generator shall be equipped with suitable fixation elements.

M 2.2.4. The fixation elements shall be strong and firmly secured to the light source(s) and the light generator.

M 3. TEST CONDITIONS

M 3.1. Application and relaxation

M 3.1.1. All samples shall be tested as specified in paragraph M.4.;

M 3.1.2. The type of light sources shall be as defined in AIS-008(Rev. 1), in particular with regard to the element of visible radiation. Other types of light sources are not permitted.

M 3.1.3. Operating conditions

LED module or light-generator operating conditions:

M 3.1.3.1. All samples shall be tested under the conditions as specified in paragraph 6.4.1.4. of this standard.

M 3.1.3.2. if not specified differently in this annex, LED modules or light-generators shall be tested inside the front fog lamp as submitted by the manufacturer.

M 3.1.4. Ambient temperature

For the measurement of electrical and photometric characteristics, the front fog lamp shall be operated in dry and still atmosphere at an ambient temperature of 23 °C ± 5 °C.

M 3.1.5. In case of light-generators:

M 3.1.5.1. Power supply

The power supply used for the starting and run-up tests shall be sufficient to secure the quick rise of the high current pulse.

M 3.1.5.2. Burning position

The burning position shall be as indicated by the applicant. Ageing and testing positions shall be identical. If the lamp is accidentally operated in the wrong direction, it shall be re-aged before measurements begin. During ageing and measurements no electrically conducting objects shall be allowed within a space as indicated by the applicant. Moreover stray magnetic fields shall be avoided.
M 3.2. **Ageing**

M 3.2.1. LED modules or light-generators shall be aged.

M 3.2.2. The tests below shall be carried out after ageing with the LED module(s) or light-generator(s) supplied by the submitted electronic light source control-gear at test voltage.

M 3.2.3. LED module(s)

Upon the request of the applicant the LED module shall be operated for 15 h and cooled down to ambient temperature before starting the tests as specified in this standard.

M 3.2.4. Filament lamps

Filament lamps shall first be aged at their test voltage for approximately one hour. For dual-filament lamps, each filament shall be aged separately.

M 3.2.5. Gas discharge light sources

With the exception of the starting test, all tests shall be carried out with light sources which have been aged for a minimum of 15 cycles having the following switching cycle: 45 minutes on, 15 seconds off, 5 minutes on, 10 minutes off.

M 4. **SPECIFIC TESTS**

M 4.1 Filament lamps approved according to AIS-034 (Part 1)(Rev. 1), gas-discharge light sources approved according to AIS-034 (Part 2) (Rev. 1) and LED modules are exempted from the tests indicated in paragraphs M4.3.1. and M4.3.2. below.

M 4.2. **Gas discharge light sources**

The starting test shall be applied to light sources which have not been aged and have not been used for a period of at least 24 hours prior to the test. The light source shall start directly and remain alight.

M 4.3. **Run-up**

M 4.3.1. Filament lamps are exempted from this test.

M 4.3.2. Gas discharge light sources

The run-up test shall be applied to light sources which have not been used for a period of at least 1 hour prior to the test. The front fog lamp shall reach at least in the point 0°, 2.5°D on the line 6 a luminous intensity:

after 1 second: 25 per cent of its objective luminous flux;

after 4 seconds: 80 per cent of its objective luminous flux.

The objective luminous flux is indicated on the submitted data sheet.
M 4.4. **Hot re-strike**

M 4.4.1. Filament lamps are exempted from this test.

M 4.4.2. Gas discharge light sources

The light source shall be started and be operated with the electronic light source control-gear at test voltage for a period of 15 minutes. The supply voltage to the electronic light source control-gear shall then be switched off for a period of 10 seconds, and be switched on again. The light source shall restart directly after being switched-off for a period of 10 seconds. After one second the light source shall emit at least 80 per cent of its objective luminous flux.

M 4.5. **Colour rendering**

M 4.5.1. Red content

In addition to measurements as described in paragraph 7. of part A or B to this standard, the minimum red content of the light of a LED module or light-generator shall be such that:

\[
k_{\text{red}} = \frac{\displaystyle\int_{\lambda=610 \text{ nm}}^{780 \text{ nm}} E_e(\lambda) V(\lambda) \, d\lambda}{\displaystyle\int_{\lambda=380 \text{ nm}}^{780 \text{ nm}} E_e(\lambda) V(\lambda) \, d\lambda} \geq 0.05
\]

where:

- \( E_e(\lambda) \) (unit: W) is the spectral distribution of the irradiance;
- \( V(\lambda) \) (unit: 1) is the spectral luminous efficiency;
- \( \lambda \) (unit: nm) is the wavelength.

This value shall be calculated using intervals of one nanometre.
M 4.6. **UV-radiation**

The UV-radiation of the LED module or light-generator shall be such that:

\[
k_{UV} = \frac{\int_{\lambda=250\,nm}^{400\,nm} E_v(\lambda) S(\lambda) \, d\lambda}{k_m \int_{\lambda=380\,nm}^{780\,nm} E_v(\lambda) V(\lambda) \, d\lambda} \leq 10^{-5} \, W/lm
\]

where:

- \( S(\lambda) \) (unit: 1) is the spectral weighting function;
- \( k_m = 683 \, \text{lm/W} \) is the maximum value of the luminous efficacy of radiation;
- (For definitions of the other symbols see paragraph L4.5.1.)

This value shall be calculated using intervals of one nanometre. The UV-radiation shall be weighted according to the values as indicated in the UV table below.

**UV Table**

Values according to "IRPA/INIRC Guidelines on limits of exposure to ultraviolet radiation". Wavelengths (in nanometres) chosen are representative; other values should be interpolated.
M 4.7. Temperature stability

M 4.7.1. Luminous intensity

M 4.7.1.1. Filament lamps and gas discharge light sources are exempted from this test.

M 4.7.1.2. A photometric measurement shall be made after 1 minute of operation with the device at room temperature. The test point to be measured is horizontal 0° vertical 2.5°D.

M 4.7.1.3. The lamp shall continue operation until photometric stability has occurred. The moment at which the photometry is stable is defined as the point in time at which the variation of the photometric value is less than 3 per cent within any 15-minute period. After stability has occurred, aiming for complete photometry shall be performed in accordance with requirements of the specific device. Photometry at all test points is required for the specific device.

M 4.7.1.4. Calculate the ratio between the photometric test point values determined in paragraph M4.7.1.2. and the values determined in paragraph M4.7.1.3. once stability of photometry has been achieved.

M 4.7.1.5. Apply the ratio calculated in paragraph M4.7.1.4. to each of the remainder of the test points to create a new photometric table that describes the complete photometry based on 1 minute of operation.

M 4.7.1.6. The illuminance values measured after one minute and until photometric stability has occurred, shall comply with the minimum and maximum requirements.

M 4.7.2. Colour

The colour of the light emitted, measured after 1 minute and measured after 30 minutes of operation, shall be within the required colour boundaries in both instances.
